well to bear in mind that an inch of rainfall weighs 227,000 pounds per acre. Extended observations through experiments conducted in Europe and in this country show that almost all cultivated crops withdraw from 300 to

500 tons of water from the soil for

each ton of dry matter produced. Does this mean that the grain farmer can grow bushels per acre for each inch of rainfall at the rate of 227,000 divided by 90,000? Not at all. For, no matter how well the soil may be tilled. a large percentage of moisture or water will escape through effect of warm winds of spring and summer. It simply means that everything should be one to conserve all moisture possible in every way possible throughout the growing season. This means putting the land in proper condition in the fall so as to retain as much rain as falls then and to secure all the moisture possible from winter spow and rain.

Where summer fallow is practiced, those spots that start to dry out in the spring should be disked as early as possible. The spring winds are mighty dry and a soil mulch is needed as early as possible. Throughout the entire season the man who practices dry farming should spare no pains to preserve the protective dry soil covering. The time to begin this work is in early

VALUABLE HAY-FORAGE CROP

Sudan Grass Is Relished by Stock and There is Little Waste-is Drought-Resisting Plant.

(By A. L. PASCHALL, Arizona Experi-

ment Station.)
I have had several years' experience in growing sudan grass and bave found it to be a very valuable hay or forage crop. It is equal to the best of other grasses in feeding value and is better than many of them. It is relished by stock and there is practically no waste in feeding it. It is one of the best, if not the best, drought-resisting and drought-evasive forage plants known.

A recent Texas station bulletin states that the average yield of sudan grass hay from 20 tests of four different substations was 7,655 pounds per acre. In cured hay it ranged from two to six tons per acre. Its acre-feeding value is more than twice that of Johnson grass. The Ohio station found that its acre feeding value is twice that of timothy.

This crop is admirably adapted to Arizona conditions and should be more extensively grown It is also valuable as a feed crop, yielding from 400 to 950 pounds per acre

IMPORTANT DRY FARM CROPS

New Bulletin Issued by Department of Agriculture Deals With Wheat, Oats. Corn. Etc.

The work with six field crops at the fourteen field stations operated by the department in the Great Plains area has recently been incorporated in a single bulletin. It combines the salient points brought out in six previous bulletins dealing with spring wheat, oats, corn, barley, mile and kafir, as well as the effects of the time of plowing. The new bulletin tells of the yields secured by different methods of handling the soil in connection with growing these crops and also includes a chart showing the rainfall by months at the stations. The bulletin, Crop Production of the Great Plains Area, No. 268, may be had by application to the editor and chief of the di-Apples, Colo., box......\$1.00@2.25 vision of publications, Washington

Benefits of Cultivation. Frequent surface cultivation used to be regarded as mainly for killing weeds. But successful gardeners of today recognize that this is not all Frequent surface cultivation with the proper tools will form a dust mulch which conserves the moisture and it will also aerate the soil.

Protection From Flies, If animals in the pasture in the day time can resert to a shed or deep shade, or to water, they are much less troubled by flies. Nets or light covers are of course a protection. Some members of the genus horselly attack principally the eye and ear.

Uniformity of Type. Uniformity of type is an important thing in the successful management of breeding bogs, especially near market time, for a uniform bunch of hogs will bring more money on any market than a mixed lot.

Storing Water in Soil. Ordinarily we must make the top soil capable of storing water, and na ture's chief method is through the usof decayed vegetation.

Moisture in Subsoil. Good subsoil always contains mo: or less moisture. Floor Pays for Itself.

them in good condition

A feeding floor will save itself in feed and manure in a single year, provided it is made of waste material around the farm. Oats for Brood Sows. Fed to sows just after farrowing oats cannot be surpassed for keeping

Farm Mare and Celt.

that nobody wants, not even them

In the fields a big team makes haste by the width of the furrow or swath they cut.

There is pleasure and inspiration in the business of breeding and handling high-class horses.

Bear in mind in breeding horses that it is just as essential to breed good feet on to them as to get weight and blood in them.

The purebred mare is a good investment to the small farmer, and if he will allow her to share the work of the place she will do nearly as much work as a gelding, and raise a good colt besides.

A well-bred mare bred to a stallion of best type will bring a colt worth as much at weaning time as a grade colt would bring at maturity, sometimes a lot more.

UNLOADING CHUTE FOR STOCK

Device Patented by Illinois Man is Especially Good for Hoge-May Be Moved Easily.

Handling of live stock, especially times cruel and a cause of real financial loss to the shipper because of lack of unloading facilities at the local stock yards. An Illinois farmer has patented the unloading chute shown here. It is strong and yet light enough to be moved freely about so that hogs may be unloaded from the wagon on to the level ground. Cleats prevent slipping of an animal that is coming down the chute, thus reducing the possibilities of broken legs and bruises. The chute may be folded up and carried on

Chute for Live Stock.

the load of stock, or put back out of the way when not in use. Its use on large farms or at small stock yards is certain to be found practical by business farmers everywhere.-Farming

DRENCHING DROVE OF HOGS

Best Way is to Drive Animals Into Pen Where They Will Have But Little Room to Move In.

The quickest and easiest way to drench a drove of hogs is to drive them into a small pen where they will have but little room to move about. To hold the animal while drenching it a noose of sash cord or quarterinch rope can be placed around the upper jaw, well back toward the angles of the lips, and the medicine thrown into the back part of the mouth with a dose syringe. As there is danger of a hog breaking a swinge it is best to use a metal one. Sometimes when the drench is bulky and the hog hard to hold, it is necessary to elevate the head and raise the forefeet off the ground. For this purpose a pulley and rope wire stretcher is recommended. It should be hung in the most convenient part of the pen and the animal secured in the usual way by placing a noose around the jaw. The end of the rope is thrown over the book in the lower pulley and the hog drawn up until it is almost off the floor. It is best to wait till the hog has become quiet, well under control, before giving it the drench as there is some danger of the medi cine getting into the air passages and doing harm.

For Fattening Sheep.

Peas are strongly recommended for fattening sheep. When fed in combi-nation with either corn, barley or cats, equal parts, better gains are made than when either of the above cereals is fed alone. This is especially true. where timothy hay or corn stover is fed as a roughage.

Test Value of Percherons. Farmers, breeders, and city users of drafters have had nearly a century to test the value of the Percherons. They have tested them in every conceivable way and found them equal to every emergency. The high esteem in which the breed is held is shown by the fact that in horse producing sections two-thirds of pure draft sires are Percherons.

Team of Brood Mares One of the farm teams should

Times.

Young Mortal Allows Himself to Be Swayed by Conditions That Surround Him.

There is no chance and no anarchy in the universe. Every god is there sitting in his sphere. The young mortal enters the ball of the firmament; there he is alone with them alone; they pouring on him benedictions and gifts, and beckoning up to their thrones. On the instant, and incessantly, fall snowstorms of illusion He fancies himself in a vast crowd. which sways this way and that, and whose movements and doings he must obey; he fancies himself poor, orphaned, insignificant. The mad crowd drives him hither and thither, now furiously commanding this thing to be done, now that. What is he that he should resist their will and think on himself? Every moment new changes and new showers of deceptions to baffle and distract him. And when, by and by, for an instant, the air clears and the cloud lifts a little, there are the gods still sitting around him on hogs that are ready for market, is oft- their thrones—they alone with him alone.-Emerson.

THICK LOVELY HAIR

Because Free From Dandruff, Itching, Irritation and Dryness.

A Good Sport. The whole family was downstairs watching a magnificent thunderstorm when the mother suddenly remembered about little Marie, who was alone in the nursery and might have awakened and became frightened. She

slipped away to quiet her. At the door she paused, and a vivid flash of lightning illuminated the whole room. Little Marie, who had been to the ball game that day with her big brother, was sitting up in bed clapping her hands with excitement and shouting:

"Atta boy, God; atta boy! Bang It again; Bang it again! Atta boy!"

May Be New Industry for India. New industries may be started in India as a result of the war. Hitherto India has exported large quantities of cotton waste to Germany. Since the outbreak of the war the export has ceased and some of the captains of the mill industry are thinking how best to utilize the cotton waste. The waste was used in Germany to turn into coarse counts, which were used for manufacturing blankets, carpets and other such articles. Some of the mill agents are contemplating the importation of waste cotton plants so as to utilize the waste for the purpose of manufacturing blankets, carpets. etc., in India.
